## SERINE PROTEASE INHIBITORS

This invention relates to compounds which are inhibitors of serine proteases and to pharmaceutical compositions thereof  
5 and their use in the treatment of the human or animal body.

The serine proteases are a group of proteolytic enzymes which have a common catalytic mechanism characterized by a particularly reactive Ser residue. Examples of serine proteases include trypsin, tryptase, chymotrypsin, elastase,  
10 thrombin, plasmin, kallikrein, Complement C1, acrosomal protease, lysosomal protease, cocoonase,  $\alpha$ -lytic protease, protease A, protease B, serine carboxypeptidase II, subtilisin, urokinase, Factor VIIa, Factor IXa, and Factor Xa.

The serine proteases have been investigated extensively over  
15 a period of several decades and the therapeutic value of inhibitors of serine proteases is well understood.

Serine protease inhibitors play a central role in the regulation of a wide variety of physiological process including coagulation, fibrinolysis, fertilization,  
20 development, malignancy, neuromuscular patterning and inflammation. It is well known that these compounds inhibit a variety of circulating proteases as well as proteases that are activated or released in tissue. It is also becoming clear that serine protease inhibitors inhibit critical cellular  
25 processes, such as adhesion, migration, free radical production and apoptosis. In addition, animal experiments indicate that intravenously administered serine protease inhibitors, variants or cells expressing serine protease inhibitors, provide a protective effect against tissue damage.

30 Serine protease inhibitors have also been predicted to have potential beneficial uses in the treatment of disease in a wide variety of clinical areas such as oncology, neurology, haematology, pulmonary medicine, immunology, inflammation and infectious disease.

10030187.200406

In particular serine protease inhibitors may be beneficial in the treatment of thrombotic diseases, asthma, emphysema, cirrhosis, arthritis, carcinoma, melanoma, restenosis, atheroma, trauma, shock and reperfusion injury.

5        Thus for example an inhibitor of Factor Xa has value as a  
therapeutic agent as an anticoagulant, e.g. in the treatment  
and prevention of thrombotic disorders. The use of a Factor Xa  
inhibitor as an anticoagulant is desirable in view of the  
selectivity of its effect. Many clinically approved  
10        anticoagulants have been associated with adverse events owing  
to the non-specific nature of their effects on the coagulation  
cascade.

Also, there are well-known associations of  $\alpha_1$  protease inhibitor deficiency with emphysema and cirrhosis and C1 15 esterase inhibitor deficiency with angioedema.

It has now been found that certain aromatic compounds carrying bulky lipophilic side chains are particularly effective as inhibitors of serine proteases, especially proteases with negatively charged P1 specificity pockets, and most especially the serine proteases thrombin, and most importantly Factor Xa. The Factor Xa inhibitors of this invention are potentially useful for the prophylaxis or treatment of thrombotic disorders such as amongst others venous thrombosis, pulmonary embolism, arterial thrombosis, myocardial ischaemia, myocardial infarction, and cerebral thrombosis. They potentially have benefit in the treatment of acute vessel closure associated with thrombolytic therapy and restenosis, e.g. after transluminal coronary angioplasty or bypass grafting of the coronary or peripheral arteries and in the maintenance of vascular access patency in long term hemodialysis patients.

Factor Xa inhibitors of this invention may, with benefit, form part of a combination therapy with an anticoagulant with a different mode of action or with a thrombolytic agent.

It has been reported in WO99/11658 and WO99/11657 that certain benzamidine and aminoisoquinoline derivatives carrying a bulky lipophilic side chain are excellent inhibitors of serine proteases. Unfortunately, it has since been found that 5 benzamidine compounds of WO 99/11658 in general demonstrate poor oral bioavailability.

Surprisingly, it has now been found that certain other aromatic compounds also show inhibitory activity against serine proteases, in particular Factor Xa, despite the lack of 10 the amidino or 1-aminoisoquinoline functionality previously believed to be crucial for activity as a factor Xa inhibitor. Many of these compounds also possess other structural features that further distinguish them from the compounds of WO99/11658 and WO99/11657.

15 Where compounds of the invention have been tested, they have generally demonstrated superior oral bioavailability in comparison with benzamidines disclosed in WO 99/11658. Also, it has been found that the compounds of the invention perform excellently in the prothrombin time assay (PT) when compared 20 to aminoisoquinolines of similar factor Xa activity and structure. The PT assay is a coagulation assay and it is widely accepted that direct acting Factor Xa inhibitors which perform well in the PT assay are more likely to be good antithrombotics.

25 In WO99/09053 certain 2-aminobenzamide compounds are disclosed as potential motilin receptor antagonists and in US 3268513 similar 2-aminobenzamide compounds are suggested as potential antibacterial agents. However, the novel compounds of the present invention have not before been suggested as 30 potential serine protease inhibitors.

Thus viewed from one aspect the invention provides a serine protease inhibitor compound of formula (I)

15 illustrated by the following examples.

The compounds of the formula (I) may be prepared by forming the -X-X- bond from appropriate intermediates. For example, when -X-X- is -CONH- or -CO-NR<sub>1a</sub>-, by reacting a compound of the formula (10): H<sub>2</sub>N-Y-(Cy)-L-Lp(D)<sub>n</sub> with a

20 compound of the formula R<sub>2</sub>-COOH, under conditions known for the formation of an amide bond. The reaction is conveniently carried out in the presence of a benzotriazole-based reagent such as 1-hydroxybenzotriazole or 1-hydroxy-7-azabenzotriazole, in an inert organic solvent such as  
25 dimethylformamide and/or methylene chloride. The reaction mixture is usually taken to 0°C and then a dehydrating agent such as dicyclohexylcarbodiimide or 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide added. Other suitable reagents and solvents are known in the art, for example an acid halide,  
30 such as R<sub>2</sub>-COCl.

Compounds wherein -X-X- is -NHCO- or -NHCH<sub>2</sub>- may be formed from the appropriate intermediates using reaction conditions for the formation of an amide bond as described above and if necessary subsequent reduction of the resulting

amide bond.

Compounds of the formula (I) wherein -X-X- is of the formula  $-\text{CH}_2\text{NH}-$  may be prepared by reducing the corresponding compound of the formula (I) wherein -X-X- is  $-\text{CONH}-$  or by reaction of a compound of formula (10):  $\text{H}_2\text{N}-\text{Y}-(\text{Cy})-\text{L}-\text{Lp}(\text{D})_n$  with a compound of the formula  $\text{R}_2\text{CHO}$  and reducing the intermediate of the formula (I) wherein -X-X- is  $-\text{C}=\text{N}-$  with, for example, sodium cyanoborohydride.

When -X-X- is  $-\text{CH}=\text{CH}-$ , the compounds of the formula (I) may be prepared using the Wittig or Horner-Emmons reactions. The corresponding compound in which -X-X- is  $-\text{CH}_2\text{CH}_2-$  can be formed by reduction of the  $-\text{CH}=\text{CH}-$  group, for example with hydrogen over a palladium-on-carbon catalyst.

An -X-X- bond of the formula  $-\text{COO}-$  or  $-\text{OC}(\text{O})-$  may be formed by reacting the appropriate hydroxy and activated carboxylic acid (e.g. acid chloride or reactive ester) intermediates under conditions known for ester bond formation.

Alternatively, a hydroxy and a carboxylic acid intermediate could be reacted together in the presence of diethylazodicarboxylate/triphenylphosphine.

An -X-X- bond of the formula  $-\text{CH}_2\text{O}-$  or  $-\text{OCH}_2-$  may be formed by reacting the appropriate hydroxy intermediate with the appropriate alkyl halide in the presence of a base. Conditions for the formation of an ether bond are known in the art.

These reactions can also be used to form intermediates, which contain one of the above -X-X- bonds.

Compounds of the formula (I) in which  $\text{R}_\text{f}$  is  $-(\text{CH}_2)_\text{c}-\text{R}_\text{c}$  may also be prepared by reductive coupling a compound of the formula (11):

with a compound of formula (12)

The reaction is conveniently performed in the presence of a reducing agent, such as sodium cyanoborohydride. Convenient solvents include alcohols, such as methanol, optionally with a halogenated hydrocarbon as solvent, such as 1,2-dichloroethane, and acetic acid. The coupling is conveniently effected at a temperature in the range of from 0 to 100°C.

The intermediates of formula (11) are believed to be novel, and are provided as a further aspect of the invention.

The intermediates of formula (11) in which X-X is CONH may be prepared by reacting a compound of formula (13)

in which  $\text{Pg}^1$  represents an amino protecting group, such as t-butoxycarbonyl, with a compound of formula  $\text{R}_2\text{-COOH}$ , under conditions known for the formation of an amide bond, for example as described hereinabove for forming a compound of formula (I), followed by deprotection.

The compounds of formula (13) may be prepared by reacting an appropriate N-protected glycine of formula (14)

in which  $\text{Pg}^2$  represents an amino protecting group that can be selectively removed in the presence of  $\text{Pg}^1$  (for example, when  $\text{Pg}^1$  is t-butoxycarbonyl,  $\text{Pg}^2$  may be benzyloxycarbonyl), with a compound of formula (15)

under amide bond forming conditions, followed by selectively removing the protecting group Pg<sup>2</sup>.

Compounds of the formula (10) in which X is CONH may be prepared by deprotecting a compound of the formula (16):

in which Pg<sup>3</sup> represents an amino protecting group, such as t-butoxycarbonyl.

The intermediates of formula (16) and the corresponding amines without Pg<sup>3</sup> are believed to be novel, and are provided as a further aspect of the invention.

Compounds of formula (16) may be prepared by reacting a compound of formula (14) with a compound of formula (17)

under amide bond forming conditions. The reaction is conveniently performed in the presence of diethylcyano-phosphate. Convenient solvents include amides, such as dimethylformamide. The temperature is conveniently in the range of from 0 to 100 °C.

Compounds of formula (17) in which R<sub>1</sub> is -(CH<sub>2</sub>)<sub>C</sub>-R<sub>C</sub>, may be prepared by reacting a compound of formula (18)

in which Pg<sup>4</sup> represents an amino protecting group, such as t-butoxycarbonyl, with a compound of formula (19)

followed by removing the protecting group,  $Pg^4$ . The reaction is conveniently performed in the presence of an acid, such as acetic acid. Convenient solvents include alcohols, such as ethanol.

Compounds of formula (17) in which  $R_X$  is  $-(CH_2)_C-R_C$  may also be prepared by reacting a compound of formula (18) with a compound of formula (19a)

in which Z represents a leaving atom or group, such as methanesulfonyloxy or benzenesulfonyloxy, followed by removing the protecting group,  $Pg^4$ .

Compounds of formula (17) in which  $R_X$  is  $-(CH_2)_C-R_C$  may also be prepared by reducing compounds of formula (20) or formula (20a)

(20)

(20a)

in which  $Pg^5$  and  $Pg^6$  each represent an amino protecting group, such as t-butoxycarbonyl, followed by removing the protecting group,  $Pg^5$ . The reduction is conveniently performed in the presence of a reducing agent, such as borane, in an ether such as tetrahydrofuran.

Compounds of formula (20) may be prepared by reacting a compound of formula (18) with a compound of formula (21)

under amide bond forming conditions.

Alternatively, compounds of formula (20) may be prepared by reacting a compound of formula (18) with a compound of formula (21a)

(21a)

in which X' is a hydrogen atom, such as bromine, followed by reaction with a compound of formula (21b)

Hence the present invention also provides a process for the preparation of a compound of formula (I) comprising:

- a) when  $-\text{X}-\text{X}$  is  $-\text{CONH}-$ , reacting a compound of formula (10) with a compound of formula  $\text{R}_2-\text{COOH}$ , under amide bond-forming conditions; or

- wherein  $\text{R}_2$ , X, Y, Cy, c and  $\text{R}_x$  are as hereinabove defined and formulae (10), (11) and (12) are as hereinabove defined,
- 15 followed if a salt is required, by forming a physiologically acceptable salt.

An amino acid of formula (23)

Ed.* 2000, 39, 3168; "Amino Acid Derivatives by Multicomponent Reactions", Dyker, G. *Angew. Chem. Int. Ed. - This intermediate may be used as has been described above
- 15 for the carboxylic starting reagents where the alpha atom is carbon.

- The skilled person will be aware that at certain stages in the synthesis of a compound of formula (I) it may be necessary to protect a reactive functional group in the
- 20 molecule to prevent unwanted side-reactions.

- The protection of amino and carboxylic acid groups is described in McOmie, Protecting Groups in Organic Chemistry, Plenum Press, NY, 1973, and Greene and Wuts, Protecting Groups in Organic Synthesis, 2nd. Ed., John Wiley & Sons, NY, 1991.
- 25 Examples of carboxy protecting groups include C<sub>1</sub>-C<sub>6</sub> alkyl groups such as methyl, ethyl, t-butyl and t-amyl; aryl(C<sub>1</sub>-C<sub>4</sub>)alkyl groups such as benzyl, 4-nitrobenzyl, 4-methoxybenzyl, 3,4-dimethoxybenzyl, 2,4-dimethoxybenzyl, 2,4,6-trimethoxybenzyl, 2,4,6-trimethylbenzyl, benzhydryl and
- 30 trityl; silyl groups such as trimethylsilyl and t-

butyldimethylsilyl; and allyl groups such as allyl and 1-(trimethylsilylmethyl)prop-1-en-3-yl.

Preferred amino protecting groups include benzyloxycarbonyl (CBz), t-butoxycarbonyl (Boc) and benzyl.

In another aspect the invention relates to a process for preparing a compound of formula I comprising deprotecting a compound of formula (I'):

15 Wherein R<sup>2'</sup> is R<sup>2</sup> (as hereinabove defined) or protected R<sup>2</sup>, Cy' is Cy (as hereinabove defined) or protected Cy and Lp(D)<sub>n</sub>' is Lp(D)<sub>n</sub> (as hereinabove defined) or protected Lp(D)<sub>n</sub>; providing at least one protecting group is present.

If necessary physiologically tolerable salts can be formed using methods known in the art.

It will be understood that the compounds of formula (I) may be isolated in the form of salts or solvates (which may or may not be physiologically tolerable), and that all such salts and solvates are therefore included within the scope of the present invention.

All novel intermediates described herein, for example the compounds of formula

10 Sodium hydroxide (3.33 g, 83.25 mmol) was dissolved in  
5 water (220 mL), and 20 mL of the resulting solution was  
removed and added to potassium osmate (410 mg, 1.11 mmol).  
The remaining sodium hydroxide solution (200 mL) was added to  
a stirred solution of t-butyl carbamate (9.9 g, 84.5 mmol) in  
n-propanol (110 mL) followed by freshly prepared t-butyl  
10 hypochlorite (9.65 mL; 83.5 mmol). After stirring for 5 min,  
the solution was cooled to 0 °C. A solution of (DHQD)<sub>2</sub>PHAL  
(1.30 g, 1.67 mmol) in n-propanol (110 mL) was added, followed  
by a solution of 3-bromostyrene (5 g, 27.31 mmol) in n-  
propanol (220 mL), followed by dropwise addition of the  
15 potassium osmate/sodium hydroxide solution. The reaction was  
stirred overnight. Saturated aqueous sodium sulfite (150 mL)  
was added, and the reaction was stirred for 15 min. The  
aqueous layer was separated and extracted with ethyl acetate  
(3x 200 mL). The combined organic layers were washed with  
20 brine and dried over MgSO<sub>4</sub>. Removal of solvent under vacuum

To a solution of Boc-R-(4-carboxyphenyl)glycine methyl ester (3.5 g) in DMF (30 mL) was added EDCI (2.60 g, 1.36 mmol) and HOBt (1.4 g, 10.4 mmol), and the mixture stirred for 10 min before cooling in a ice bath and bubbling in ammonia gas for 5 min. The mixture was stirred for 2 h at room temperature and then diluted with ethyl acetate and washed with water. The aqueous solution was extracted with a little ethyl acetate and the combined organics washed with brine. The organic solution was evaporated to an oil which was purified by flash chromatography (SiO<sub>2</sub> - dichloromethane/ethyl acetate 0 - 25%) to give Boc-R-(4-carboxamidophenyl)glycine methyl ester (1.7 g, 48%).

#### Intermediate C-10

#### 1-[Boc-D,L-(Pyridin-2-yl)glycinyI]-4-[2-(4-pyridinyI)ethyl]-piperazine.

#### Method C-B

15 To a stirring solution of ethyl Boc-D,L-(pyridin-2-yl)-glycine (16.3 g, 58.2 mmol) in 1,4-dioxane (100 mL) was added a solution of LiOH hydrate (2.68 g, 64 mmol) in water (100 mL). After 2 h, another solution of LiOH hydrate (1.34 g, 32 mmol) in water (50 mL) was added. After another 2 h, the  
20 solvent was evaporated in vacuo to give 13.56 g of off-white solid.

A portion of the solid (3 g, 11.6 mmol) was dissolved in DMF (75 mL) and cooled to 0 °C. To this solution was added diethyl cyanophosphonate (2.3 g, 13.9 mmol),

25 N,N-diisopropylethylamine (6 g, 46.4 mmol) and then 1-[2-(4-pyridyl)ethyl]piperazine hydrochloride (3.8 g, 12.8 mmol), and the reaction was allowed to slowly warm to room temperature overnight. The next morning, the solvents were removed in vacuo and the residue was dissolved in ethyl  
30 acetate and washed with satd aq. NaHCO<sub>3</sub> and brine, then dried with Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated in vacuo. The residue was then dissolved in a minimal volume of dichloromethane and chromatographed over silica gel, eluting with a step gradient of 2% through 10% methanol (with 2 N NH<sub>3</sub>) in dichloromethane.

The product containing fractions were combined and concentrated in vacuo to give 2.31 g (47%) of an off-white foam.

## Preparation of Starting Materials

## 1-Boc-isonipecotic acid.

Isonipecotic acid (15.0 g, 116 mmol) was dissolved in THF (300 mL), water (150 mL) and 6 N NaOH (40 mL). Di-tert-butyl dicarbonate (26.6 g, 122 mmol) was added and the mixture stirred overnight. The mixture was diluted with water and ethyl acetate, and the layers separated. The water layers were extracted with ethyl acetate, and the organic layers

discarded. The water layer was diluted with  $\text{KHSO}_4$  (2 N, pH~4) and extracted with ethyl acetate. The organic layer was washed with brine, dried ( $\text{Na}_2\text{SO}_4$ ), filtered and concentrated to provide 1-Boc-isonipecotic acid (23.9 g, 90%) as a white solid.

30 Boc-D-Phg-OH (40.0 g, 159.2 mmol) and 1- (1-methyl-  
piperidin-4-yl)piperazine (32.1 g, 175.1 mmol) were slurried  
in anhydrous dichloromethane (1.5 L) under N<sub>2</sub>. The mixture  
was then cooled to -15 °C in an ice/MeOH bath. Triethylamine  
(26.6 mL, 191.0 mmol) was added slowly, maintaining the

temperature at -15 °C, followed by slow addition of diethyl cyanophosphonate (29.0 mL, 191.0 mmol), again maintaining temp at -15 °C. The reaction mixture was allowed to warm to room temperature overnight. The reaction was then quenched with 5 the addition of satd NaHCO<sub>3</sub> (500 mL), and the layers were separated. The aqueous layer was then extracted with dichloromethane (3 x 1 L). The organic layers were combined, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered and concentrated in vacuo to give a crude oil. Purification using (Biotage) Flash 10 Chromatography with 7.5% (2 M NH<sub>3</sub> in MeOH) in THF gave 53.6 g (81%) of the title compound.

The product prepared by both the method of Example 48a  
and Example 48a (Alternative Synthesis) was found to be the

mono-hydrochloride salt and to be amorphous. Analysis by microscopy showed glassy non-birefringent particles; and analysis by DSC failed to reveal a melting point, in agreement with amorphous material. Using a microbalance flow system, 5 the original material was cycled through a vapor pressure isotherm determination, where the material deliquesced, then allowed to dehydrate. Upon dehydration, there were formed crystals which were birefringent by microscopy; and a melting point of about 174 °C was demonstrated for the newly 10 crystallized, hygroscopic material.

#### Example 48b

1-(Indole-6-carbonyl-D-phenylglyciny)-4-(1-methylpiperidin-4-yl)piperazine Difumarate.

15 The difumarate salt is conveniently prepared by dissolving the free base in methanol or 95% ethanol and warming to about 50 °C (for example at a concentration of 460 mg in 15 mL). Two molar equivalents of fumaric acid (for example 232.2 mg) are then added (for example, as a 0.25 M solution in methanol or as a suspension in 3 mL 95% ethanol). 20

Following cooling and crystallization, and isolation and drying, the product is obtained as thin crystalline needles, with a sharp melting point at about 213 °C by DSC.

1-[4-Methoxybenzoyl-D-(2-chlorophenyl)glycinyll]-4-(1-methylpiperidin-4-yl)piperazine Hydrochloride.

10 1-[4-Methoxybenzoyl-D,L-(2-chlorophenyl)glycinyll]-4-(1-methylpiperidin-4-yl)piperazine (8.20 g, 18.16 mmol) was divided into 2 g lots and each lot was dissolved in a mixture of chloroform (1.0 mL), isopropanol (13 mL) and heptane (26 mL). These samples were then individually chromatographed  
15 using preparative chiral HPLC (Chiralcel OD, 8 x 34 cm, eluting with 35% isopropanol/65% heptane with 0.4% DMEA for 21 min at a flow rate of 350 mL/min). Analytical HPLC of the the racemic mixture (Chiralcel OD, 4.6 x 250 mm, eluting with 35% isopropanol/65% heptane with 0.4% DMEA, 1.0 mL/min, UV  
20 detection at 260 nm) revealed two peaks, baseline resolved. The fractions from the preparative HPLC runs containing the peak with the shorter retention time were combined and concentrated in vacuo to give 3.71 g of isomer 1. The fractions containing the later running isomer were combined  
25 and concentrated to give 3.80 g of isomer 2. Biological evaluation of the two samples revealed isomer 1 to be over ten times more potent than isomer 2 and on that basis, isomer 1 was tentatively assigned as the D-isomer. Isomer 1 was then chromatographed over silica gel (Biotage Quad 12/25 System, 25  
30 mm KP-Sil [32-63um particle size] columns, eluting with a gradient of 0-6% 2N ammonia/methanol in dichloromethane) and the product containing fractions were combined and concentrated. The residue was then redissolved in dichloromethane and to this stirring solution was added 1 M

HCl in diethyl ether (4.33 mL, 4.33 mmol). The precipitate was filtered and dried in vacuo to give 2.3 g (49%) of the title compound.

### Method I-F

To a stirring solution of D,L-(2-chlorophenyl)glyciny]-4-(1-methylpiperidin-4-yl)piperazine (0.458 g, 1.31 mmol) in dichloromethane (5 mL) and DMF (2 mL) was added indole-6-carboxylic acid (0.233 g, 1.44 mmol). The solution was cooled to 0 °C and DEPC (0.218 mL, 1.44 mmol) was added. After 24 h, the solution was concentrated in vacuo and the residue was dissolved in 5% acetic acid/methanol and loaded onto an SCX column. The column was washed with methanol, and then the compound was eluted with 50% (2 N ammonia/methanol) in dichloromethane. The product containing fractions were combined and concentrated in vacuo. The residue was then chromatographed over silica gel, eluting with a gradient of 0-5% (2 N ammonia/methanol) in dichloromethane. Again, the product containing fractions were combined and concentrated in vacuo to give 0.6 g of off-white solid. The HCl salt was then prepared using Method I-D to give 290 mg (39%) of the title compound.

## 10 Assay protocols

### Enzyme Inhibition assays:

The ability of a test compound to inhibit factor Xa may be  
15 evaluated in one or more of the following Enzyme Inhibition  
assays, or in other standard assays known to those skilled in  
the art.

### Enzyme Inhibition Assay 1

Enzyme assays were carried out at room temperature in 0.1M  
phosphate buffer, pH7.4 according to the method of Tapparelli  
et al (J. Biol. Chem. 1993,268,4734-4741). Purified human  
factor Xa, trypsin, thrombin and plasmin were purchased from  
25 Alexis Corporation, Nottingham, UK. Urokinase was purchased  
from Calbiochem, Nottingham, UK. Chromogenic substrates for  
these enzymes; pefachrome-FXA, pefachrome-TRY, pefachrome-TH,  
pefachrome-PL and pefachrome-UK were purchased from Pentapharm  
AG, Basel, Switzerland. Product (p-nitroaniline) was  
30 quantified by adsorption at 405nm in 96 well microplates using  
a Dynatech MR5000 reader (Dynex Ltd, Billingshurst, UK). Km  
and Ki were calculated using SAS PROC NLIN (SAS Institute,  
Cary, NC, USA, Release 6.11) K<sub>m</sub> values were determined as

trypsin/pefachrome-TRY. Inhibitor stock solutions were prepared at 40mM in Me2SO and tested at 500µM, 50µM and 5µM. Accuracy of Ki measurements was confirmed by comparison with Ki values of known inhibitors of factor Xa and trypsin.

5 In agreement with published data, benzamidine inhibited factor Xa, trypsin, thrombin, plasmin and urokinase with Ki values of 155µM, 21µM, 330nM, 200nM and 100nM respectively. NAPAP inhibited thrombin with a Ki value of 3nM. Compounds of the  
10 invention were found to have activity in these assays.

#### Enzyme Inhibition Assay 2

Human factor Xa and human thrombin were purchased from Enzyme  
15 Research Laboratories (South Bend, Indiana, USA). Other proteases were from other commercial sources. Chromogenic para-nitroanilide peptide protease substrates were purchased from Midwest Biotech (Fishers, Indiana, USA).

20 The binding affinities for human factor Xa were measured as apparent association constants (K<sub>ass</sub>) derived from protease inhibition kinetics as described previously.<sup>a,b,c,d</sup> The apparent K<sub>ass</sub> values were obtained using automated (BioMek-1000) dilutions of inhibitors (K<sub>ass</sub> determinations are  
25 performed in triplicate at each of four-eight inhibitor concentrations) into 96-well plates and chromogenic substrate hydrolysis rates determined at 405 nm using a Thermomax plate reader from Molecular Devices (San Francisco). For factor Xa inhibition, the assay protocol was: 50 µl buffer (0.06 M tris,  
30 0.3 M NaCl, pH 7.4); 25 µl inhibitor test solution (in MeOH); 25 µl human factor Xa (32 nM in 0.03 M tris, 0.15 M NaCl, 1 mg/ml HSA); finally, 150 µl BzIleGluGlyArgpNA (0.3 mM in water) added within 2 min to start hydrolysis. Final factor Xa was

3.2 nM. Free [Xa] and bound [Xa] were determined from linear standard curves on the same plate by use of SoftmaxPro software for each inhibitor concentration and apparent  $K_{ass}$  calculated for each inhibitor concentration which produced 5 hydrolysis inhibition between 20% and 80% of the control (3.2 nM factor Xa): apparent  $K_{ass} = [E:I]/[E_f][I_f] = [E_b]/[E_f][I^0 - I_b]$ . The apparent  $K_{ass}$  values so obtained are approximately the inverse of the  $K_i$  for the respective inhibitors [ $1/appK_{ass} = app K_i$ ]. The variability of mean 10 apparent  $K_{ass}$  values determined at the single substrate concentration was +/- 15%. The assay system  $K_m$  was measured as 0.347 +/- 0.031 mM [ $n=4$ ]; and  $V_{max}$  was 13.11 +/- 0.76  $\mu M/min$ .

15  $K_{ass}$  values were determined with thrombin and other proteases using the same protocol with the following enzyme and substrate concentrations: thrombin 5.9 nM with 0.2 mM BzPheValArgpNA; XIa 1.2 nM with 0.4 mM pyroGluProArgpNA; XIIa 10 nM with 0.2 mM HDProPheArgpNA; plasmin 3.4 nM with 0.5 mM 20 HDValLeuLyspNA; nt-PA 1.2 nM with 0.8 mM HDIleProArgpNA; and urokinase 0.4 nM with 0.4 mM pyroGluGlyArgpNA; aPC 3 nM with 0.174 mM pyroGluProArgpNA; plasma kallikrein 1.9 nM with D-ProPheArgpNA; bovine trypsin 1.4 nM with 0.18 mM BzPheValArgpNA.

25 In general, the compounds of formula (I) exemplified herein have been found to exhibit a  $K_i$  of 10  $\mu\text{M}$  or less in Assay 1 and/or a  $K_{\text{ass}}$  of at least  $0.1 \times 10^6$  L/mole in Assay 2.

The ability of a test compound to elongate Partial

30 Thromboplastin Time (Prothrombin Time) may be evaluated in the following test protocols.

Partial Thromboplastin Time (Prothrombin) Test Protocol

Venous blood was collected into 3.2% (0.109M) trisodium citrate vacutainer tubes at 1 volume of anticoagulant to nine volumes of blood. The blood cells were separated by centrifugation at 700g for ten minutes to yield plasma, which was frozen at 70°C until required.

To perform the test, 100µl of plasma was pipetted into a glass test tube, 1µl of test compound in DMSO was added, and allowed to warm to 37°C over two minutes. 100µl of warm (37°C) Manchester (tissue thromboplasin) reagent (Helena Biosciences, UK) was added, allowed to equilibrate for two minutes. 100µl of warm (37°C) 25mM calcium chloride solution was added to initiate clotting. The test tube was tilted three times through a 90° angle every five seconds to mix the reagents and the time to clot formation recorded. Data from a series of observations and test compound concentrations are analysed by a SAS statistical analysis program and a CT2 (Concentration required to double clotting time) for each compound is generated.

Compounds of the invention were found to significantly elongate the partial thromboplastin time (Prothrombin time).

#### Alternative Prothrombin Time and APTT Protocols

Coagulation Determinations. Prothrombin Times and APTT values were determined in HUMAN PLASMA with a STA instrument (Stago).

BioPT is a special non-plasma clotting assay triggered with human tissue factor (Innovin). Possible binding to albumen or to lipid was assessed by comparing the BioPT effects in the presence/absence of 30 mg/ml human albumen (HSA) and 1 mg/ml phosphatidyl choline (PC). Inhibitors were delivered in 50% MeOH vehicle.
